

# AQUAMIS

## AQUAculture Management Information System

### Water Quality Monitoring

Water is the base resource for the activity of Fish and Sea Food producers. Based on modeling and/or in-situ sensor networks, AQUAMIS provides regular, precise and tailor-made information regarding water quality, temperature and water level. Outputs of used water can be monitored and the impact on the eco-system controlled

### Warning System

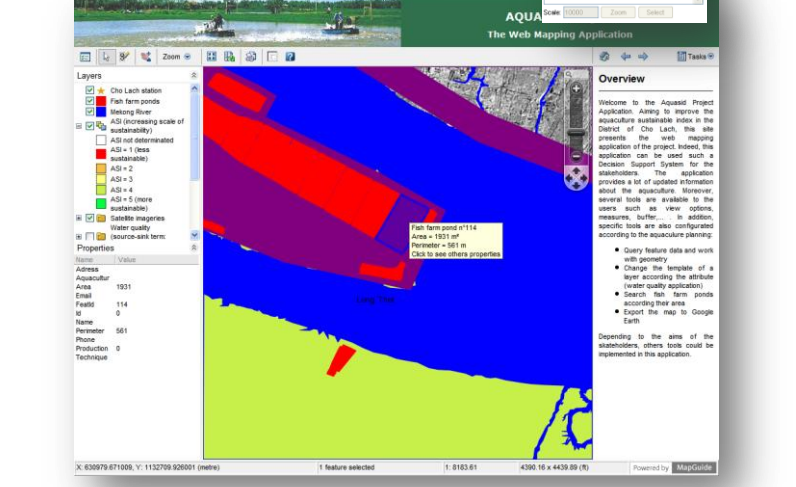

Viruses, algae bloom, jellyfish, ... are critical threats for fish and sea food farmers. It is vital to be informed in time in order to protect the production. Thanks to collaborative information systems and in relation with modeling systems, AQUAMIS provides alerts as soon as a threat to your exploitation is reported.

### Mapping

AQUAMIS Web Mapping application helps farmers and cooperatives to better manage their production sites. Satellites offer up-to-date cartography and value-added information.

### Territory and Natural Resources Management for a Sustainable Development

Impacts on environment are monitored in order to adapt the production and control the sustainability of the economy based on natural resources. AQUAMIS Web Mapping Application and modeling/monitoring systems are pertinent tools for the observation, prevention and repression of environmental impacts.

# GeoMIS TOOLKIT

## FOR GEOSPATIAL INFORMATION & SERVICES

- Monitoring**
- Air Quality
  - Water Quality
  - Forest
  - Crop
  - Agri-Environment
  - Mining
  - Land Mapping

- Prevention & Intervention**
- Sea pollution
  - Flood
  - Wildfire
  - Geohazards
  - Industrial Risks
  - Public Health

AQUAMIS is a dedicated product for Aquaculture Management based on GEOMIS Toolkit developed by SPACEBEL.
